

Calculadora de IMC no NetBeans

The screenshot shows the NetBeans IDE with a single file named 'CalculadoraIMC.java' open. The code is written in Java and implements a BMI calculator. It uses the Scanner class for input and System.out for output. The program prompts the user for weight and height, calculates the BMI, and then prints the result with a formatted string. It also includes a simple conditional logic to categorize the BMI as 'Abaixo do peso', 'Peso normal', or 'Sobrepeso'.

```
1 package com.mycompany.calculadoraimc;
2
3 import java.util.Scanner;
4
5 public class CalculadoraIMC {
6
7     public static void main(String[] args) {
8
9         Scanner entrada = new Scanner(System.in);
10
11         double peso;
12         double altura;
13         double imc;
14
15         System.out.println(x: "=== CALCULADORA DE IMC ===");
16
17         System.out.print(s: "Digite seu peso (kg): ");
18         peso = entrada.nextDouble();
19
20         System.out.print(s: "Digite sua altura (m): ");
21         altura = entrada.nextDouble();
22
23         imc = peso / (altura * altura);
24
25         System.out.printf(format: "Seu IMC é: %.2f\n", args: imc);
26
27         if (imc < 18.5) {
28             System.out.println(x: "Abaixo do peso");
29         } else if (imc < 25) {
30             System.out.println(x: "Peso normal");
31         } else if (imc < 30) {
32             System.out.println(x: "Sobrepeso");
33         }
34     }
35 }
```
